Q 5. What is monetary policy? Explain how the different instruments of monetary policy can cure the recession and help in the revival of an economy (10)

Q 6. Venezuelan inflation approaches 150,000%

Venezuelan President Nicolas Maduro's most-recent attempt to stop his country's massive inflation problems is failing, at least according to one measure. The Bloomberg Café Con Leche Index, which gauges Venezuela's inflation through the price of a cup of coffee, showed an annual inflation rate of 149,900 percent after its latest reading. The staggering inflation print comes after the Venezuelan government issued a new currency, the "sovereign bolivar." One sovereign bolivar was worth 100,000 "old" bolivars. The purpose of the new currency was to normalize day-to-day transactions. The new currency is also pegged to illegal. These efforts initially helped as the sovereign bolivar held in a range between 95 and 115 per U.S. dollar, Bloomberg reported citing data from Monitor Dolar. On Monday, however, the bolivar traded at 276.53 per dollar, Monitor Dolar data showed. Venezuela's troubles come as the country with the biggest oil reserves in the world deals with an ongoing humanitarian crisis. Venezuela faces shortages of food, medicine and other basic goods. Venezuela's inflation is expected to keep spiraling out of control, too. The International Monetary Fund said in June it expected inflation in Venezuela to hit 1 million percent in 2018, noting the country is "stuck in a profound economic and social crisis."
